2550/183 APD2494-1-US

What is claimed is:

1. A radio transmission power control circuit comprising:

- a radio frequency (rf) downconverter that produces a downconverter output 2 having a frequency equal to the frequency difference between a first 3 downconverter input based on a transmitted signal of a radio transmitter and a second downconverter input based on a local 5 oscillator signal; a receiver baseband circuit that processes the downconverter output to 7 produce a power signal representative of the transmitted signal; and 8 a feedback control circuit that produces a transmitter gain control signal to 9 control transmitted signal power so as to minimize the difference 10
- 2. A circuit according to claim 1, wherein the radio transmitter is part of a half-

between the power signal and a power reference signal.

- 2 duplex radio transceiver also having a receiver circuit such that the receiver
- 3 baseband circuit is used by the receiver circuit when the radio transmitter is
- 4 inactive, and wherein the local oscillator signal is used by the radio transmitter
- 5 such that the transmitted signal has a frequency determined by the local oscillator
- 6 signal.

11

- 1 3. A circuit according to claim 1, further comprising:
- an analog-to-digital converter that converts the power signal to a
- 3 representative digital power signal; and
- 4 wherein the feedback control circuit produces the transmitter gain control
- signal so as to minimize the difference between the digital power signal
- and the power reference signal.

2550/183 APD2494-1-US

4. A circuit according to claim 1, wherein the first downconverter input is

- 2 developed by a directional coupler that senses the transmitted signal.
- 5. A circuit according to claim 1, wherein the radio transmitter is part of a
- 2 wireless local area network transceiver.
- 6. A circuit according to claim 1, wherein the radio transmitter is part of a time
- 2 division duplex system.
- 7. A method of controlling radio transmission power, the method comprising:
- 2 producing with a radio frequency (rf) downconverter a downconverter output
- having a frequency equal to the frequency difference between a first
- downconverter input based on a transmitted signal of a radio
- transmitter and a second downconverter input based on a local
- 6 oscillator signal;
- 7 processing the downconverter output with a receiver baseband circuit to
- 8 produce a power signal representative of the transmitted signal; and
- producing a transmitter gain control signal to control transmitted signal power
- so as to minimize the difference between the power signal and a power
- reference signal.
- 8. A method according to claim 7, wherein the radio transmitter is part of a half-
- 2 duplex radio transceiver also having a receiver circuit such that the receiver
- baseband circuit is used by the receiver circuit when the radio transmitter is
- inactive, and wherein the local oscillator signal is used by the radio transmitter
- 5 such that the transmitted signal has a frequency determined by the local oscillator
- 6 signal.

2550/183 APD2494-1-US

- 9. A method according to claim 7, further comprising:
- converting the power signal to a representative digital power signal; and
- wherein the transmitter gain control signal is produced so as to minimize the
- difference between the digital power signal and the power reference
- 5 signal.
- 10. A method according to claim 7, wherein the first downconverter input is
- 2 developed by a directional coupler that senses the transmitted signal.
- 1 11. A method according to claim 7, wherein the radio transmitter is part of a
- 2 wireless local area network transceiver.
- 1 12. A method according to claim 7, wherein the radio transmitter is part of a time
- 2 division duplex system.
